**6. What is Transcription?**

**Solution:**

Transcription is the first step of gene expression, where a particular segment of DNA is copied into RNA, especially messenger RNA (mRNA). This mRNA serves as a template for protein synthesis in the process known as translation. In eukaryotes, transcription occurs in the nucleus, while in prokaryotes, it takes place in the cytoplasm.

**💡 Quick Tip**

In transcription, the RNA polymerase enzyme plays a key role in synthesizing RNA from a DNA template. It's important to remember that mRNA is the product of transcription and that this process is essential for protein synthesis.
